# AMAZONE ploughs

## Ploughing today

The plough is symbolic in agriculture. Alongside crop establishment, fertilisation and plant protection, soil tillage plays a key role in the success of arable farming. Sustainability and a more efficient level of operation will be the decisive factors by which agriculture will be judged in the future.

The desire to maintain a sustainable soil structure, to increase productivity and, above all, to achieve higher profitability lies behind the design. The use of modern ploughs, alongside conservation tillage techniques and alternative sowing systems, remains at the forefront when it comes to improved yields and thus the success of any soil tillage operation.

AMAZONE ploughs are characterised by their robust technology, an excellent quality of work, optimal adaptation to local conditions and thus offer the highest possible cost-effectiveness.

### The benefits:

- ✓ Individual matching of the plough to suit any application
- ✓ Simple adjustment and comfortable operation
- ✓ Long lifespan thanks to the robust construction

# For intelligent crop production

## Utilising the right technique is crucial!

It is not philosophy but the right choice of soil tillage method that is critical to success. Conventional sowing systems that are based on the use of the plough are still widespread. As a result of this and due to ever-changing parameters such as commodity prices, energy production, reduction of fallow vegetation, etc., many farms practice both conventional and mulch sowing methods in parallel. The yield-guaranteeing function of the plough is highly valued here.

## Advantages of inversion soil tillage

- ✓ Effective weed control via mechanical means by light deprivation, effective control around field borders
- ✓ Quicker soil warming and better soil aeration for increased yields in crops which demand higher soil temperatures
- ✓ The only soil tillage option in constantly wet conditions
- ✓ Reduced risk of disease carryover to the following crop
- ✓ Accelerates the microbial activity in the soil by oxygen enrichment
- ✓ Mechanical control of UV light sensitive soil pests, slugs and mice

# Cayros mounted ploughs

Operation made easy!

! “The settings centre is compact and easy to use.”

(“agrarheute” magazine Cayros XS 4+1 VS long-term test · 03/2019)

# The settings centre

**Logical and comfortable**

## Logical plough adjustment

The basis for perfect plough adjustment is an adjustment system that is logical and easy to understand. The correct plough adjustment quite simply means that operating costs will be reduced, as perfect adjustment has a very positive effect on wear and tear as well as fuel consumption.

The tried and tested linkage design of the Cayros ploughs is particularly well-suited for this purpose.

## Hydraulic front furrow width adjustment

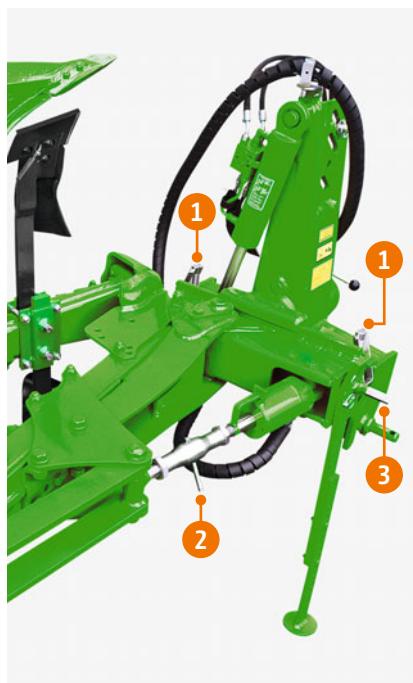

The furrow width of the first body can be adjusted as an option from inside the tractor cab using a double-acting hydraulic cylinder. This provides a high level of comfort, especially in hilly terrain, for strongly varying soils or where frequent tractor changes are required.

## Quick and easy!

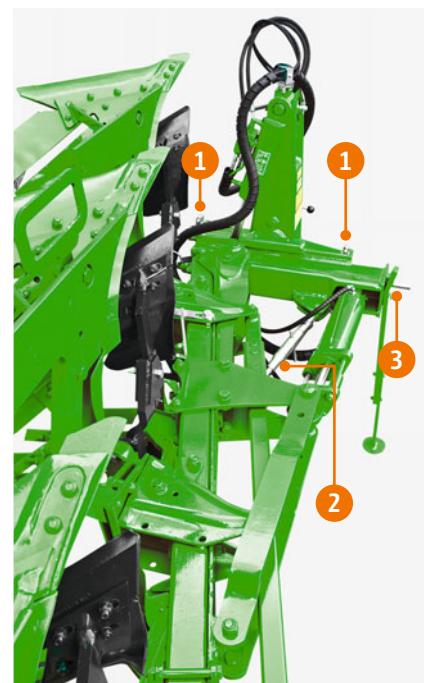

**Fine-tuning of the plough can be divided into the following steps:**

Adjust the working depth of the plough via the support wheel and lower links of the tractor.

- ① Adjust the tilt using the adjustment spindles on the headstock.
- ② Set the draft point. The top link is aligned with the driving direction.
- ③ Set the furrow width of the first body, using the sliding headstock.

Cayros setting centre

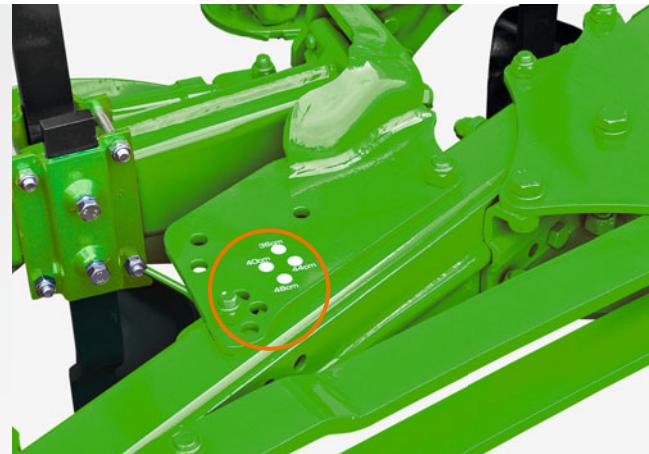

Cayros V setting centre

# Furrow width adjustment

Comfortable and reliable

# Easily adjustable

Mechanical adjustment of the furrow width

## Cayros – mechanical precision

The standard furrow width adjustment can be altered in 4 steps by manually pivoting the leg fixing consoles. In this way, the implement can easily be adapted to different conditions (soil conditions, tractor, etc.). When the furrow width is adjusted, all the soil-engaging metal and support wheels are also automatically adjusted. No additional correction is necessary.

## Cayros V – comfortable hydraulic operation

The furrow width can be smoothly and hydraulically adjusted from the tractor in all Cayros V ploughs. A very clearly visible display, consisting of a scale and indicator, keeps the driver informed about the furrow width setting. The integrated kinematics of the Cayros V also automatically set the draft point, the front furrow width, all the soil engaging tools and the support wheel.

CONNEX bushings

## The advantages of the Cayros V

- ✓ Easy adjustment with automatic adaptation of the front furrow, the draft point and accessories when adjusting the furrow width – no manual correction required
- ✓ The optimised lever design of the pivot points ensures a low adjustment force and bearing load, thus reducing wear and tear and resulting in a longer service life
- ✓ The pivot points of the leg holder are outside the beam, so that any weakening of the box section due to additional drill holes is avoided
- ✓ Minimal pivot points result in minimum wear and tear and reduced maintenance requirements
- ✓ The use of CONNEX bushings ensures a longer service life

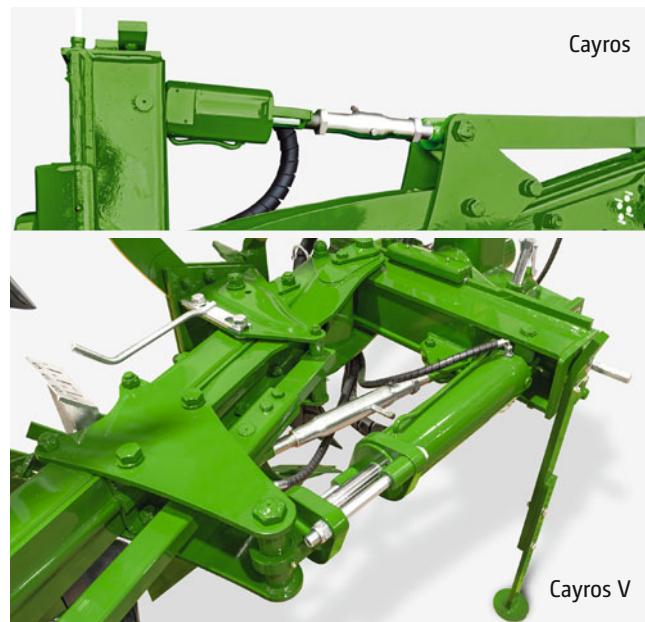

# Perfect down to the last detail

## Swivel frame – simple turnover with memory cylinder

To increase ground clearance when the plough is turning and make the turning smoother, all ploughs can be equipped with an inswing mechanism. This automatically swings the plough beam towards the centre of the tractor before the turnover starts and then back to its original working position once the plough has turned over. This shift in the centre of gravity also means that there is less strain on the tractor's rear lift linkage and reduces the risk of tipping while working on hilly terrain.

## The benefits

- ✓ Higher ground clearance when turning the plough
- ✓ Smooth turning
- ✓ Reduction in the load on the tractor linkage
- ✓ Reduced risk of tipping

Cayros V ploughs can be optionally equipped with a memory cylinder with a floating piston, which also serves as a swivel cylinder

Optimum transmission of power across a variety of tractors as a result of 4 different attachment points for the top link

## Comfortable turnover hydraulics

All headstocks on Cayros ploughs feature a turnover system that uses a double-acting cylinder with automatic change-over. This ensures that the turnover of the plough is smooth and jerk-free.

All headstocks have slotted top link holes, so that the plough/tractor combination can contour follow in uneven ground.

## Elastic lower link cross shaft

The one-piece lower link cross shaft is particularly elastic and provides the optimum absorption of shock loads generated during ploughing and especially during transport. Furthermore, the lower link cross shaft can be coupled quickly and without using any tools, which facilitates attachment to the tractor.

# First-class quality for long-lasting wear parts

**!** “The quality of work was also highly praised.”  
 (“Landwirt Österreich” Cayros M 950 practice test · 03/2019)

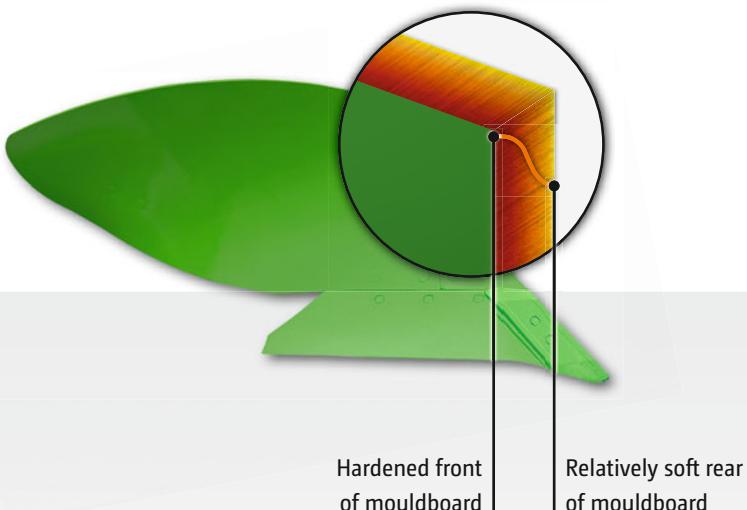

## The ©plus tempering process – the know-how of heat treatment

As a manufacturer of wearing parts for the soil tillage industry, we can look back on a history spanning decades. Continual advances in materials and production technology as well as our expertise in heat treatment are the basis for achieving the highest possible quality in our wearing parts for ploughs.

Carbon in its purest form, diamond, is the hardest naturally occurring substance. A hardening process involving the introduction of carbon into the steel is used to increase the hardness and durability of ©plus wearing parts. AMAZONE uses a unique hardening process to achieve a very high level of hardness on the front of components, such as the shin, to produce the optimum resistance to wear. The back remains relatively soft but at the same time extremely tough and impact resistant.

### Benefits of the ©plus hardening process:

- ✓ Longer service life
- ✓ High impact resistance
- ✓ Less pulling power requirement
- ✓ Reduced fuel consumption
- ✓ Less sticking to the smoother outer surface

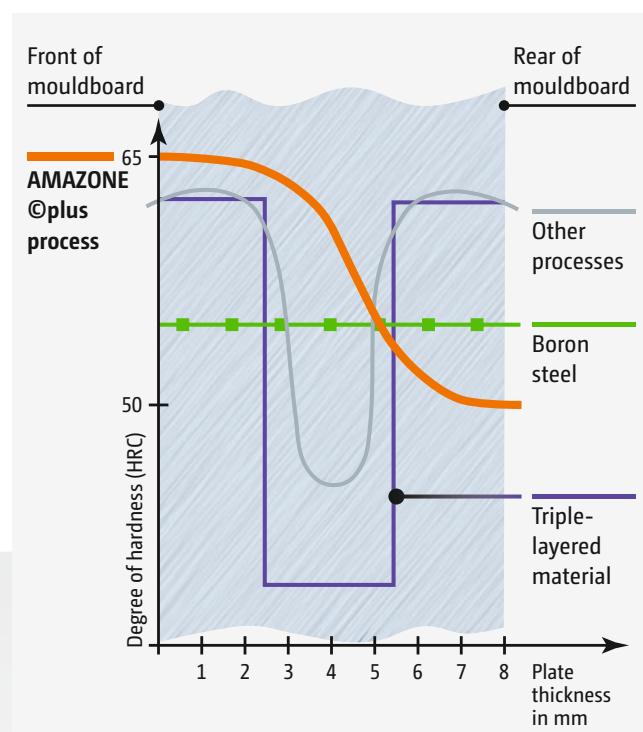

**!** The ©plus hardening process

## Box section beam made of high-grade steel for a long service life

All the beams on AMAZONE ploughs are produced from a special high-tensile steel. The over-sized wall thickness means that, not only is the whole beam robust, but also all the bolt fixings are extremely strong with this heavy wall thickness also preventing any hole elongation or deformation of the box section around the bolt fixings. A further feature of the ploughs is the design of the plough beam without any weld seams.

## Cross-section of mouldboard – comparison of different hardening methods

# AMAZONE plough bodies

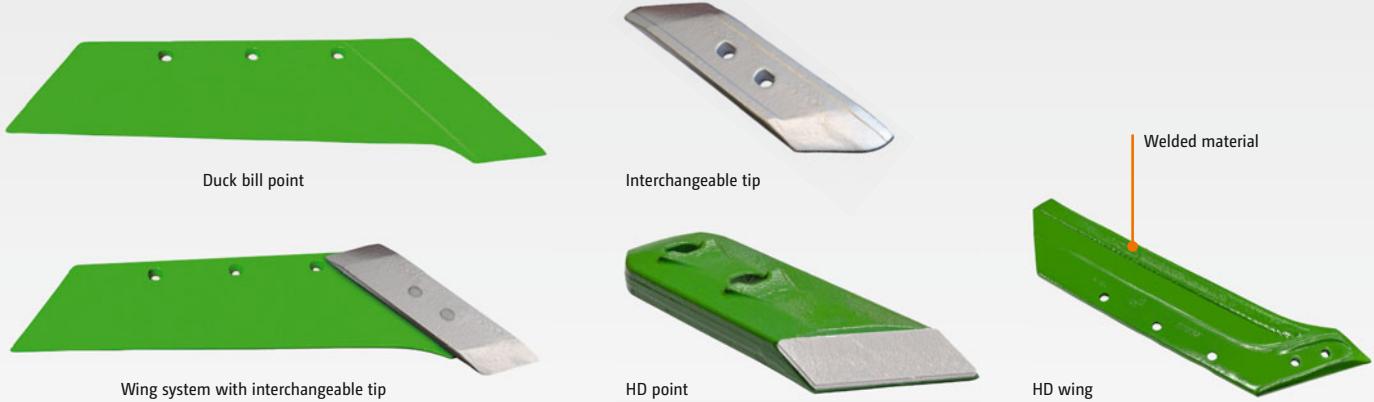

Long-lasting, easy to pull, first class performance

## Long-lasting and a clean finish

The plough body is at the heart of any plough and is first in line when it comes to quality of work and is responsible for an effective operation of the plough.

Clean, efficient incorporation of those crop residues, even under the most arduous of conditions, such as, for example, in maize stubble, is just one of the quality criteria. However, AMAZONE plough bodies also master other challenges brilliantly, such as working on hilly terrain.

## Easy pulling from the tip

The basis for the economical use of a plough is, of course, by keeping the required pulling force to a minimum, thus reducing the fuel consumption. In combination with the unique ©plus hardening process which gives very hard and smooth surfaces, the clever design guarantees the ease of pulling for which AMAZONE ploughs are renowned. All plough bodies come equipped with our specially designed points. The special profile gives less resistance and smoother draft. The self-sharpening area has been made much thicker, thus considerably increasing the life of the ploughshare.

## HD version

To further improve service life, the optional HD points are also available which feature tungsten carbide tips plus wings with hard-faced welded edges. These are available for nearly all of the plough bodies.

## Lasts four times as long

The long length ensures an even side loading, which reduces fuel consumption and ensures perfect ploughing.

**!** “We were also very satisfied with the WL 430 plough body. The long, scrolled mouldboard completely inverts the soil while, at the same time, cleans out the bottom of the furrow.”

(“Landwirt Österreich” Cayros M 950 practice test · 03/2019)

## Interchangeable tip with a special profile

The interchangeable tip saves the wing blade and thus reduces wearing costs. Its shallow design, the self-sharpening, pulling power saving penetration range and the 15 mm thick side reinforcements make the interchangeable tip, due to the targeted use of material in the wear zones, extremely robust resulting in exceptional longevity.

## Advantage of AMAZONE plough bodies

- ✓ Thorough and consistent incorporation of crop residues to promote fast and effective decomposition and encourages soil life
- ✓ Subsequent operations are made easy by an even surface profile and the finely crumbed surface
- ✓ A bigger furrow clearance enables the use of wider tyres and helps with the incorporation of large amounts of crop residues
- ✓ The reduced pulling force required results in fuel savings

- ✓ All plough bodies have four-way reversible landsides.

# Stone safety protection

Semi-automatic stone release

## Mechanical stone release with shear bolt

Shear bolts are the tried and tested standard solution for this system. Under load, the shear bolt snaps off at the pre-determined breaking point and the plough body gives way to the obstacle by swivelling upwards. Raise the plough, insert a new shear bolt and off you go. The high release forces of the shear bolt allow operation also in heavy and hard soils.

### The advantages:

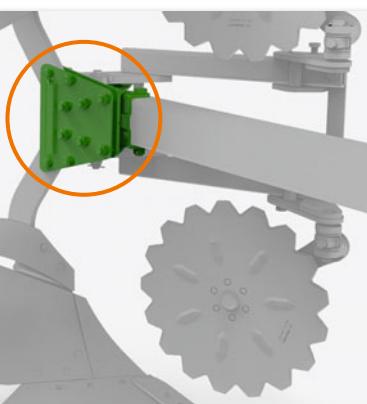

- ✓ Double action shear bolts
- ✓ Hardened flange plates
- ✓ High-quality shear bolts; in 10.9 quality

## Semi-automatic as an alternative for the Cayros M

With the semi-automatic stone release system, the plough body swings out of the way by overcoming the strong pressure exerted by the two coil springs. For the Cayros M, this system is a viable alternative to using shear bolts or the non-stop stone release system when the ground is not excessively stony.

### The advantages:

- ✓ Low additional weight over and above a shear bolt protection system
- ✓ Adjustable release force

Shear bolt stone safety protection

# Hydraulic NonStop stone protection

## Cayros S with NonStop stone safety device

The hydraulic NonStop stone safety release features, in principle, one hydraulic cylinder per plough body with each one directly connected to a nitrogen-filled hydraulic accumulator. When triggered, the plough body pushes a piston into the accumulator via the hydraulic cylinder. The gas is compressed and automatically returns the body to its initial position after passing the obstacle. The NonStop stone safety device is available for the smallest ploughs and for the large models.

### The advantages:

- ✓ Simple adaptation of the release force
- ✓ Smooth and material protecting operation
- ✓ Exchangeable ball joints and sockets
- ✓ As standard, with additional shear bolt
- ✓ The trip forces decrease as the lift height of the released plough body increases

## The NonStop stone safety device is available in 2 versions.

### Option 1:

#### Central hydraulic accumulator on the hydraulic ram

In its simplest version, the hydraulic accumulator is directly combined with the hydraulic cylinder forming a compact unit.

### The advantages:

- ✓ The plough bodies release completely independently of each other
- ✓ The plough bodies can be pretensioned differently
- ✓ No hydraulic hoses or pipes on the plough beam

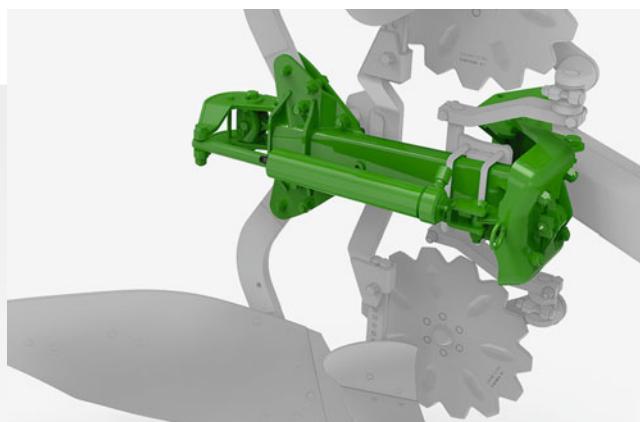

### Option 2:

#### Hydraulic accumulators with inter-connected pipework

Via the connection of the individual components, the release force can be also adjusted centrally across all the bodies. An isolator valve on each hydraulic accumulator means that the setting on each plough body can, from choice, also be set independently to different pressures.

### The advantages:

- ✓ The adjustment of the release force is carried out across all plough bodies in just one step (even whilst on the move)
- ✓ Similar pipe cross-sectional area means that each furrow has only a slight influence on each other

# Simply neat

For those looking to perform

## Trash boards

A cost-effective alternative to skimmers when incorporating surface crop residues. With additional support for leg as standard.

## Deflector boards

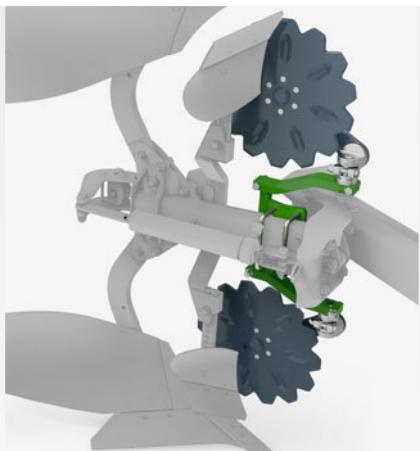

In conjunction with the skimmers, the deflector plates prevent straw (especially maize straw) from wrapping around the leg.

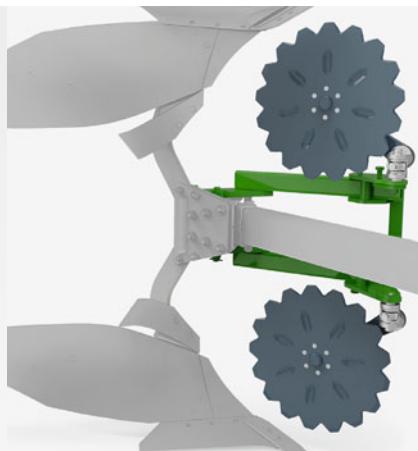

## Sword landsides

The sword landside is an alternative to the disc coulter, which, especially on heavy, stony ground ensures a clean furrow wall and also reduces the wear and tear on the plough body.

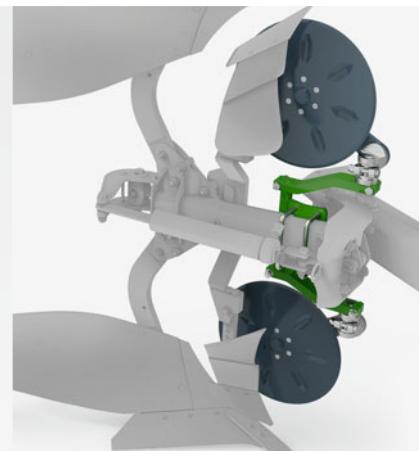

500 mm serrated disc coulter

600 mm serrated disc coulter

500 mm smooth disc coulter

## Disc coulters – for clean, tidy ploughing

The disc coulter is important for a clean ploughing performance. Disc coulters also make a considerable contribution to efficient ploughing. The disc coulters precise cutting action helps achieve full inversion and complete incorporation of crop residues as well as leaving an effective furrow clearance.

Serrated or smooth disc coulters with a diameter of 500 mm or 600 mm are available. The depth of the coulters is adjusted via finely graduated toothed discs.

As an alternative, spring-loaded disc coulters can also be fitted to ploughs with hydraulic overload protection. These provide more space between the coulter and skimmers. The disc coulter can then also avoid obstructions independently of the plough body.

### The benefits:

On shear bolt ploughs, the discs can also be adjusted in the driving direction, leaving plenty of clearance between the body and the coulter.

## Skimmers

The use of skimmers ensures blockage-free ploughing, even under the most difficult of conditions. The following skimmers are available:

### M0 Skimmer

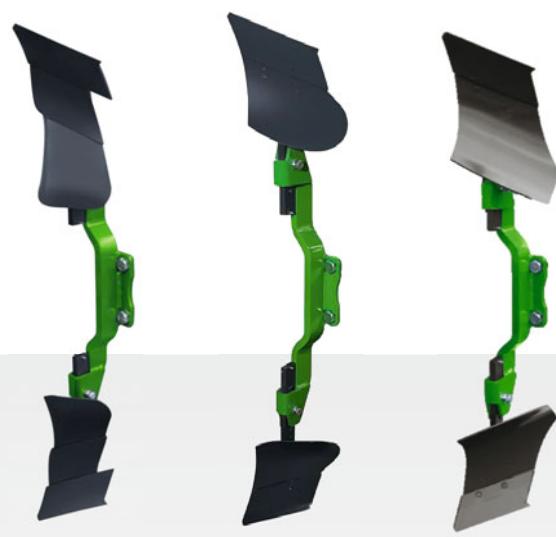

The M0 skimmer is universally suited for use in grassland ploughing as well as where there are large amounts of crop residues, especially maize straw.

### G1 Skimmer

The use of the G1 skimmer ensures blockage-free ploughing, especially on heavy and sticky ground or when ploughing grassland for the first time.

### M3 Skimmer

Optimum performance with extreme crop residues (especially maize straw), recommended only in conjunction with large point to point clearances of 105 or 115 cm. Not available for NonStop stone safety ploughs.

- Fully adjustable version (working depth, stepless pull-in force adjustment and three-position throwing angle adjustment) optionally available for the M0 and G1 skimmers and included as standard with the M3 skimmer.

# Options for all applications

The right solution to meet those special requirements

Thanks to the combi wheel and the easily visible road lighting kit, the Cayros can also be safely driven on roads

## Subsoiler points for deep loosening

Under certain conditions, it may be necessary to loosen the surface below the working depth of the plough body. The loosening fingers are height-adjustable and can be easily changed to reduce the cost of wear and tear.

## Lower link cross shaft adapter for more lift height

To increase the lift height of the plough, all lower link cross shafts can be optionally provided with an adaptor, which moves the cross-shaft into a lower position and thus increases ground clearance during turnover. The lower link cross-shaft adaptor can be retrofitted at any time.

## Lighting kit for additional road traffic safety

All ploughs can also be fitted with a road lighting kit for road transport. Either pointing to the left (for transport with plough in working position) or double-sided for use with combined transport/depth wheels, these lighting systems ensure safety whilst driving on roads.

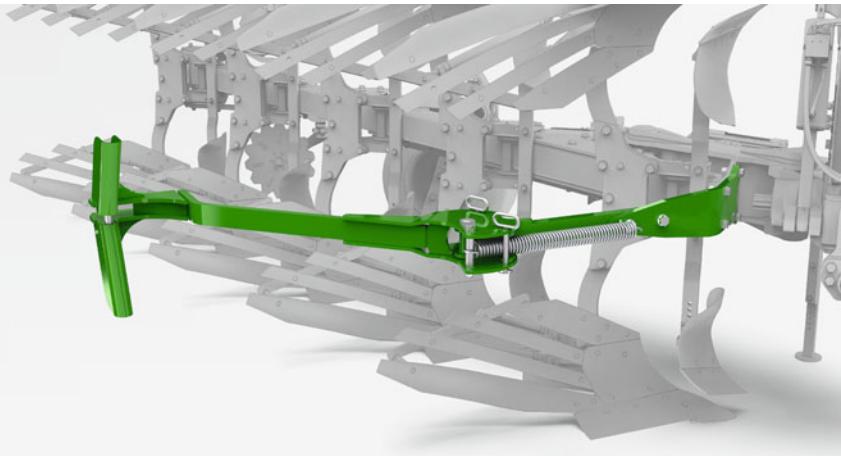

The road lighting kit is quick and easy to remove before beginning any field work

# Packers

Levelling and reconsolidation in one pass

Robust and adjustable swivel press arm

## Swivel press arm

A swivel press arm can be installed as an option for combination with a packer. All packer arms are equipped with a spring-loaded catcher which dampens the load peaks

caused when picking up the packer. The arm is operated hydraulically via an additional spool valve for optimum comfort.

## Packers – for even greater efficiency

AMAZONE has expanded its packer range via a strategic co-operation with the company, Tigges for even greater efficiency on your farm. As a result, it is now possible to combine AMAZONE ploughs with packers from Tigges in a matching AMAZONE design. Various ring diameters as well as different ring profiles are offered. In addition, there is a choice of single or double ring packers up to a working width of 4.65 m.

# Experience from practice – ploughs in work

## ! “A fantastic finish”

In addition to the good experience gained from their existing AMAZONE machinery and a previous Vogel & Noot plough, the choice of plough body convinced the owners of Düfelsiek Farm to buy a Cayros XMS V. They were not disappointed. On the contrary. “The Cayros has always ploughed exceptionally well and leaves a fantastic finish on our farm, even when directly incorporating the harvest residues after grain maize (without any pre-mulching)”, said the operations manager. In his opinion, this is particularly due to the “great share”. Another factor, according to the operations manager, is the extremely good furrow clearance of the plough body, which enables ploughing with 710 section tyres. The easy pulling of the plough also makes its use extremely economical. The day to day work is lightened by the easy adjustment of the Cayros. “I can send any of my workers out with this machine,” the operations manager added.
